

## *JSDPLO1*

- 1- Using constructor DP Display the area and perimeter of an object created from using Rectangle Constructor that has width and height properties and 2 extended methods calculating area, perimeter. Override .toString() function to display a message declaring the width, height, area and perimeter of the created object. Create Class Property that counts numbers of created objects and Class method to retrieve it.
- 2- Create your Company structure from employees with different departments (developing, Testing ,Quality controls and Designers)  
Using factory DP create Array OF Employees and display their data  
-make sure each time has only one Team lead  
--separate each type in different files
- 3- with using Prototype DP to create object of Student Data (Name,Age,Track,Array OF Courses ,Array Of Degress) then  
-create different instance of Students which different data and display it
